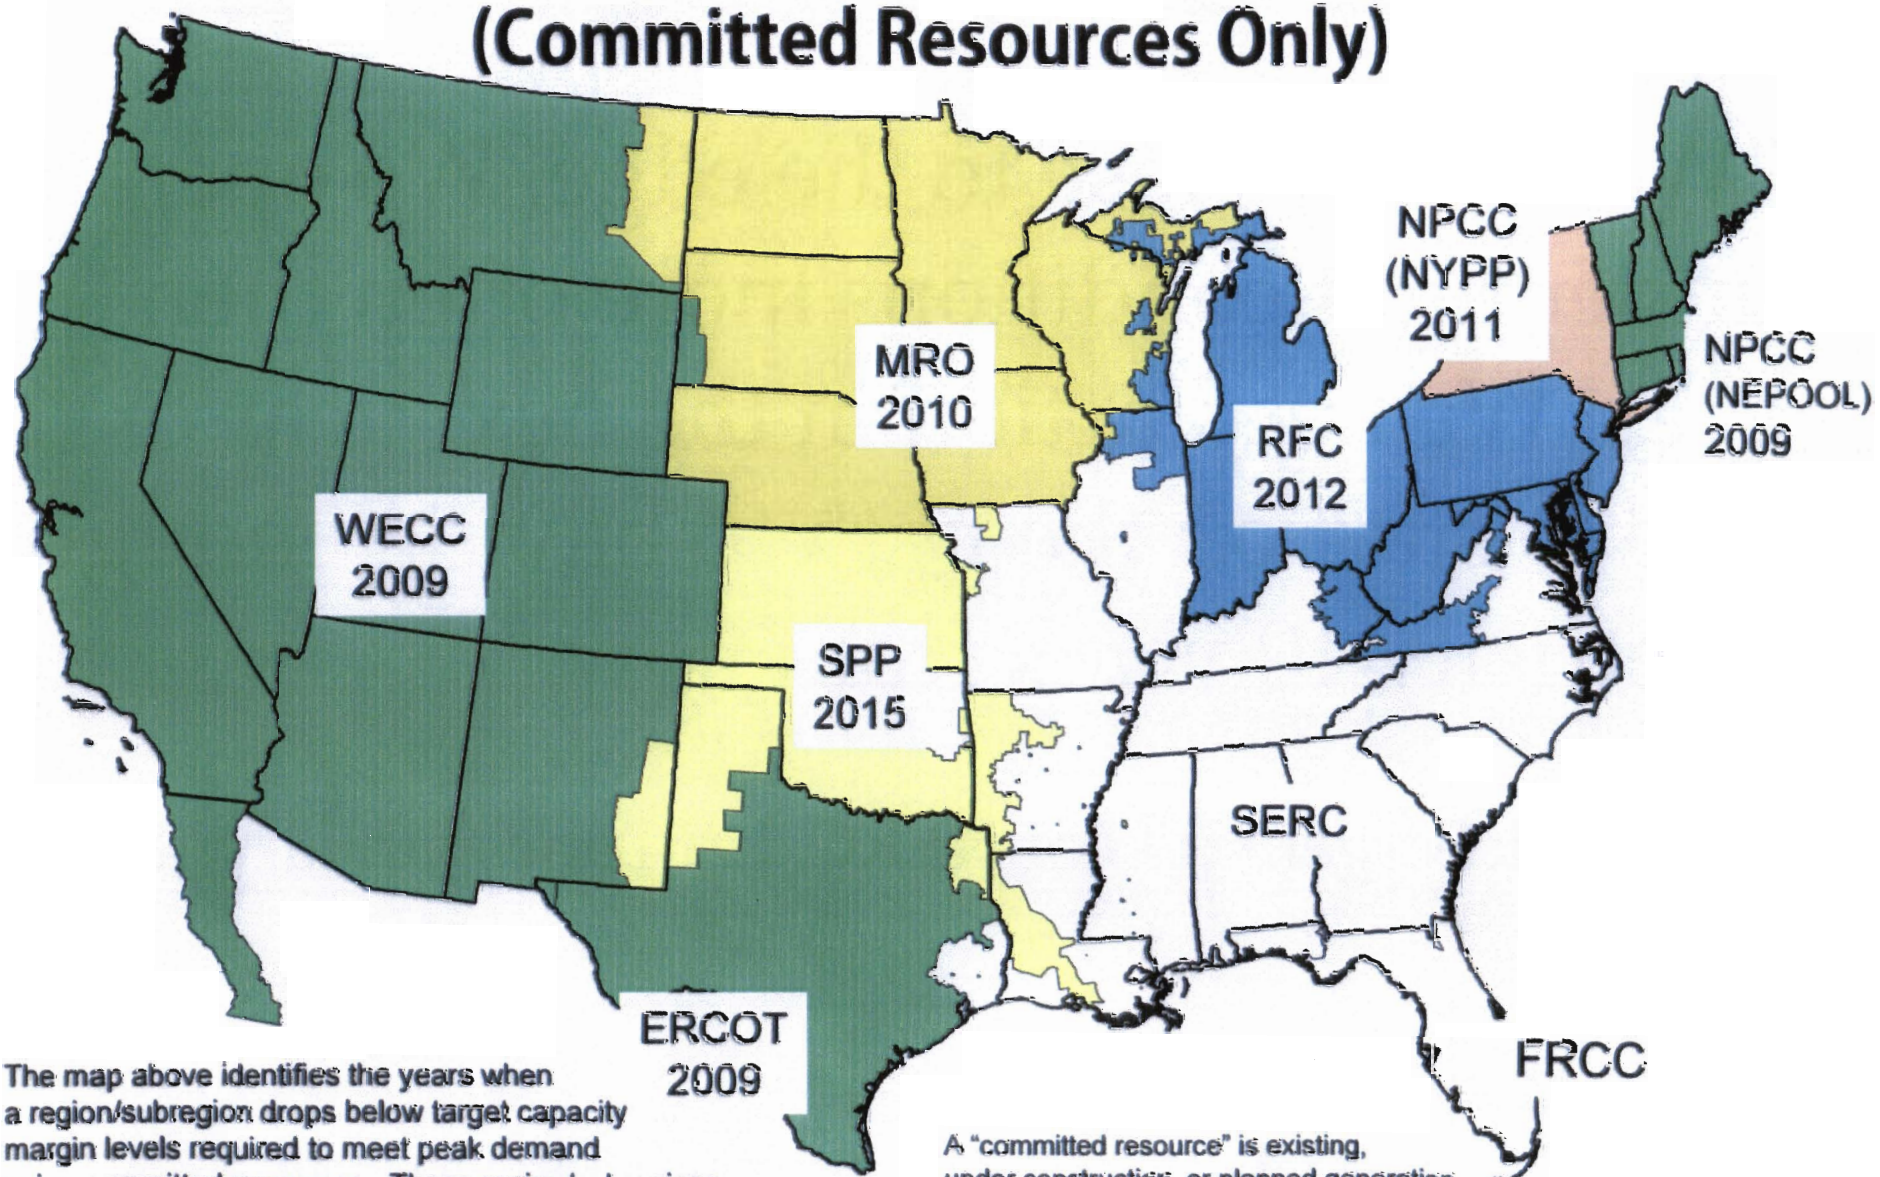
Year When Resources Drop Below Target Capacity Margins (Committed Resources Only)



The map above identifies the years when a region/subregion drops below target capacity margin levels required to meet peak demand using committed resources. Those region/subregions not identified are not projected to drop below their target margin levels in the next decade.

A "committed resource" is existing, under construction, or planned generation capacity the utility owns or has a firm contract for and for which a firm transmission capability has also been committed to meet peak demand.
